Hello Amaan,

I am applying for the Senior Database Reliability Engineer role in Auckland. I build and run production database platforms on AWS, from schema and high-availability design through to automated, repeatable rollouts. Most of my recent work has been on Aurora PostgreSQL and RDS, with the infrastructure written as code.

How my experience matches the role:

- **Aurora PostgreSQL and RDS in production:** at AngelOne I managed Amazon RDS and Aurora PostgreSQL clusters, covering deployment, maintenance, and availability.
- **AWS CDK, CloudFormation, and Terraform:** I have used these to build and maintain database infrastructure, and I write automation in Python, Bash, and PowerShell.
- **Database design and high availability:** I designed read replicas, sharding, and table partitioning for large PostgreSQL datasets, and I built multi-datacenter HA with Patroni.
- **Disaster recovery:** I own failover and recovery testing for PostgreSQL clusters, and I automated SQL Server disaster-recovery scripting for entire instances.
- **CI/CD and reliability:** I built GitHub Actions deployment pipelines for PostgreSQL clusters, saving 80 hours a week of manual SRE effort, and I led incident response for production systems.
- **Scale and leadership:** I built SQLMonitor, an open-source tool monitoring 500+ SQL Servers, moved 38 TB of availability group databases, and led an SRE pod of 3 engineers.

I am available on 7 days' notice and open to relocation. I would be glad to talk about how I can help your team run its database platform reliably. Happy to speak at a time that suits your schedule.
